

**ABSTRACT OF THE DISCLOSURE**

5       A food serving container for keeping food articles chilled  
while being served. The food serving container includes an  
exterior bowl member designed for being positioned on a support  
surface. A cooling member is selectively positioned against an  
interior surface of the exterior bowl member. The cooling member  
10 is designed for being frozen. An interior bowl member is  
selectively coupled to the exterior bowl member whereby the  
cooling member is positioned between the interior bowl member and  
the external bowl member when the cooling member is positioned  
against the exterior bowl member and the interior bowl member is  
15 coupled to the exterior bowl member. The interior bowl member is  
substantially concave whereby the interior bowl member is designed  
for receiving the food articles. The cooling member is designed for  
cooling the food articles in the interior bowl member to inhibit  
spoiling of the food articles positioned in the interior bowl  
20 member.
